-----

I have read from a codeforces blog that if we add `#include <bits/stdc++.h>` in a C++ program then there is no need to include any other header files. How does `#include ...`

I've always used a `*.h` file for my class definitions, but after reading some boost library code, I realised they all use `*.hpp`. I've always had an aversion to that file extension, I think mainly be...

24 Typically, a `.h` file is a header template that is filled in to become the actual header by a configure script based on the outcome of several tests for features present on the target platform.

The `.h` files are used to expose the API of a program to either other part of that program or other program is you are creating a library. For example, the program ...

```
#ifndef MY_HEADER_H #define MY_HEADER_H #include <stdio.h> void doStuffWith(FILE *f); // need the definition of FILE from stdio.h #endif
```

 If header A depends on ...

51 `.h` files, or header files, are used to list the publicly accessible instance variables and methods in the class declaration. `.cpp` files, or implementation files, are used to ...

Possible Duplicates: `*.h` or `*.hpp` for your class definitions What is the difference between `.cc` and `.cpp` file suffix? I used to think that it used to be that: `.h` files are header files for C and C...

In short: `iostream.h` is deprecated--it is the original Stroustrup version. `iostream` is the version from the standards committee. Generally, compilers point them both to the same thing, but ...

The entire form of `conio.h` is "Console Input & Output." In C programming, the console input and output

function is provided by the header file conio.h. Since we learned that ...

The stdio.h is a file with ".h" extension that contains the prototypes (not definition) of standard input-output functions used in c.
