Do I need to provide power to a Bess project?

State laws and system operator requirements vary by location, but there is often a requirement to provide power to some of the non-battery-charging loads with retail power (i.e., not wholesale power sourced from the grid level that your BESS project is connected to).

What are the basic utilities required for a Bess project?

Basic Utility Access Requirements Some may underestimate the basic utilities required for the construction and operation phases of BESS projects, which are most commonly water, power, and communications. The unthinkable happens - there is a fire on the BESS equipment, and access to water is needed.

What considerations should a developer consider before determining a Bess equipment layout?

Developers must anticipate the requirements for land use before determining the BESS equipment layout in the initial design process. These considerations include leaving room for landscape and setback buffers, drainage infrastructure, interconnection equipment, and access roads for semi-trailers and cranes.

What is the best Bess site design?

The best BESS site design finds the right balance between a compact layout and open access. More compact sites can lower the overall cost of the project by shortening the length of underground wires and cables, and by reducing construction needs for earthwork.
