This page discusses minor bodies in the solar system, which include small, irregularly shaped objects like asteroids, comets, and meteoroids, as well as Kuiper Belt and Oort Cloud Objects.

Small solar system bodies--along with the Sun, planets, and dwarf planets--help make up our Solar System. Small solar system bodies include things like comets, asteroids, ...

Visualize and download the gravity fields of several planets, the moon, and a few small-bodies. A table listing the dates when past great comets were observable by the naked eye.

The small bodies populate the solar system in vast numbers and include the mostly rocky asteroids, or minor planets, the predominantly icy comets, and the fragments of such ...

The study of small bodies in space, like asteroids and comets, is essential for learning about our Solar System. These objects can tell us a lot about how the Solar System ...

Very small rocks orbiting the Sun are sometimes called meteoroids to distinguish them from the larger asteroids. When such a body enters the Earth's atmosphere it is heated to ...

A small Solar System body (SSSB) is an object in the Solar System that is neither a planet, a dwarf planet, nor a natural satellite. The term was first defined ...

Other areas of the Solar System also encompass small bodies in smaller concentrations. These include the near-Earth asteroids, centaurs, comets, and scattered disc objects.

Dwarf planets and so-called "small Solar System bodies" -- a term that includes comets and asteroids -- also orbit the Sun. This illustration shows three of the best places to ...

Objects in the Solar System orbit a central star, our Sun. The largest bodies are known as planets and officially there are 8 of them. New type of objects have been defined in ...
